

Understanding the \$2,500 Instant Funded Account

1. Initial Balance – \$2,500

This is the starting account balance provided by the prop firm. It is the firm's capital, not your own. If you grow the account, you receive your agreed share of the profits.

2. Initial Leverage – 1:30

Each \$1 controls up to \$30 in market exposure. A \$2,500 account therefore has buying power of up to \$75,000, though using maximum leverage is risky.

3. Trading Period – Unlimited

There is no deadline to complete a challenge or hit a target. You may continue trading provided you obey the rules.

4. Minimum Trading Days – 7

You must trade on at least seven separate trading days before becoming eligible for payouts.

5. Maximum Daily Profit – None

There is no cap on the amount of profit you may make in one day.

6. Maximum Daily Loss – \$75 (3%)

You must never lose more than \$75 in a single trading day. Exceeding this limit usually results in account termination.

7. Maximum Overall Loss – \$125 (5%)

Your account equity must never fall below \$2,375. This limit applies over the lifetime of the account.

8. Profit Target – None

Unlike challenge accounts, there is no profit target you must reach before requesting payouts.

9. Profit Split – 80%

You keep 80% of trading profits while the prop firm keeps 20%. Example: \$1,000 profit = \$800 to you, \$200 to the firm.

10. Fee – \$99

This is the purchase fee for the funded account.

Daily vs Overall Loss

Daily loss resets each trading day. Overall loss tracks the maximum drawdown from the starting balance and does not reset.

Recommended Risk Management

Risk only about \$5–\$10 per trade, take 2–4 quality trades per day, stop trading after a \$30–\$40 daily loss, and focus on consistency.

Summary

Advantages: instant funding, unlimited trading period, no profit target, 80% profit split. Main drawback: strict drawdown rules requiring disciplined risk management.
